

Serial No.: 09/899,410

In response to the Official Action mailed on March 26, 2003, please enter the following amendments. Please also re-examine and consider the application in view of these amendments and appended remarks.

In The Claims:

Please amend the claims as follows:

Please cancel Claims 3, 4, and 26 without prejudice or disclaimer of the subject matter contained therein.

The current version of all the claims of the present application will start on the next page.

Serial No.: 09/899,410

Claims 3, 4, and 26 (Cancelled).

1. (Currently Amended) An optical network system comprising:

a data service hub; 401

at least one optical tap for dividing a downstream optical signal between one or more subscribers of the optical network system; 210

at least one subscriber optical interface connected to the optical tap for receiving the downstream optical signal from and sending upstream optical signals to the at least one optical tap; 219, house

180 a laser transceiver node disposed between the data service hub and the optical tap, for communicating optical signals to and from the data service hub and to and from the optical tap, and for apportioning bandwidth that is shared between groups of subscribers connected to a respective optical tap of the optical network system, the laser transceiver node further comprising:

mux as input to HST units in fig 4 or module control connected to mux 1858, 1859  
at least one multiplexer coupled to an optical tap routing device;

at least one optical transmitter connected to the at least one multiplexer, for transmitting downstream optical signals received from the data service hub to at least one subscriber optical interface of the optical network system;

units in Fig 4  
at least one optical receiver connected to the at least one multiplexer, for receiving and converting upstream optical signals from at least one subscriber optical interface of the optical network system;

inherent in SSP or 180 in that two different signals are combined  
at least one diplexer connected to the at least one optical transmitter and optical receiver, each diplexer combining downstream RF modulated optical signals received from the data service hub with the downstream optical signals, each diplexer being connected to a respective optical waveguide; and

one or more optical waveguides connected between respective optical taps and the laser transceiver node, for carrying the upstream optical signals and the downstream optical signals, whereby the number of the waveguides is minimized while optical bandwidth for subscribers is controllable by the laser transceiver node in response to subscriber demand use.

Serial No.: 09/899,410

~~2. (Original) The optical network system of claim 1, wherein the laser transceiver node further comprises an optical tap routing device for apportioning the bandwidth between subscribers of the optical network system.~~

5. (Original) The optical network system of claim 1, wherein the laser transceiver node accepts gigabit Ethernet optical signals from the data service hub and partitions the Ethernet optical signals into a predetermined number of groups.

6. (Original) The optical network system of claim 1, wherein the laser transceiver node comprises passive cooling devices in order to operate in a temperature range between -40 degrees Celsius to 60 degrees Celsius.

7. (Original) The optical network system of claim 1, wherein the laser transceiver node is mountable on a strand in an overhead plant environment.

8. (Original) The optical network system of claim 1, wherein the laser transceiver node is housed within a pedestal in an underground plant environment.

9. (Original) The optical network system of claim 1, wherein a distance between the laser transceiver node and the data service hub comprises a range between zero and eighty kilometers.

Serial No.: 09/899,410

10. (Original) The optical network system of claim 1, wherein the ~~laser transceiver node~~ comprises ~~at least one optical transmitter~~, each optical transmitter comprises one of a Fabry-Perot laser, a distributed feedback laser, and a vertical cavity surface emitting laser (VCSEL).

11. (Original) The optical network system of claim 1, wherein the ~~laser transceiver node~~ further comprises <sup>the</sup> an optical tap routing device ~~that~~ allocates additional or reduced optical bandwidth to at least one subscriber optical interface relative to other subscriber optical interfaces in the optical network system.

DI  
C24  
12. (Currently Amended) The optical network system of claim 1, wherein the [laser transceiver node comprises an] optical tap routing device [that] manages upstream and downstream optical signal protocols.

13. (Previously Amended) The optical network system of claim 12, wherein one of the protocols comprises a time division multiple access protocol.

14. (Original) The optical network system of claim 1, wherein data bit rates for the upstream and downstream optical signals are substantially symmetrical.

15. (Original) The optical network system of claim 1, wherein each optical waveguide handles data rates of at least 450 Mb/s.

Serial No.: 09/899,410

~~16. (Original) The optical network system of claim 1, wherein each optical tap comprises at least one optical splitter.~~

17. (Original) The optical network system of claim 1, wherein one of the optical taps servicing a particular group of subscriber optical interfaces is connected to another optical tap.

18. (Original) The optical network system of claim 1, wherein each optical tap propagates upstream and downstream optical signals in addition to downstream RF modulated optical signals.

19. (Original) The optical network system of claim 1, wherein each subscriber optical interface comprises an analog optical receiver, a digital optical receiver, and a digital optical transmitter.

20. (Original) The optical network system of claim 1, wherein the optical waveguides are a first set of optical waveguides, the optical network system further comprising a second set of optical waveguides disposed between the data service hub and laser transceiver node, the second set comprising a first waveguide for carrying upstream optical signals to the data service hub, and a second optical waveguide for carrying downstream optical signals to the laser transceiver node.

Serial No.: 09/899,410

21. (Currently Amended) An optical network system comprising:

a data service hub;

at least one optical tap for dividing a downstream optical signal between one or more subscribers of the optical network system;

at least one subscriber optical interface connected to the optical tap for receiving the downstream optical signal from and sending upstream optical signals to the at least one optical tap;

a laser transceiver node disposed between the data service hub and the at least one subscriber optical interface, for communicating optical signals to and from the data service hub and to and from the optical tap, and for apportioning bandwidth that is shared between groups of subscribers connected to a respective optical tap of the optical network system, at least one optical tap being disposed within the laser transceiver node, the laser transceiver node further comprising:

at least one multiplexer coupled to an optical tap routing device;

at least one optical transmitter connected to the at least one multiplexer, for transmitting downstream optical signals received from the data service hub to at least one subscriber optical interface of the optical network system;

at least one optical receiver connected to the at least one multiplexer, for receiving and converting upstream optical signals from at least one subscriber optical interface of the optical network system;

at least one diplexer connected to the at least one optical transmitter and optical receiver, each diplexer combining downstream RF modulated optical signals received from the data service hub with the downstream optical signals, each diplexer being connected to a respective optical waveguide; and

one or more optical waveguides connected between respective optical taps and the laser transceiver node, for carrying the upstream optical signals and the downstream optical signals, whereby the number of the waveguides is minimized while optical bandwidth for subscribers is controllable by the laser transceiver node in response to subscriber demand.

Serial No.: 09/899,410

22. (Original) The optical network system of claim 21, wherein each optical tap comprises an optical splitter.

23. (Original) The optical network system of claim 21, wherein one of the optical taps servicing a particular group of subscriber optical interfaces is connected to another optical tap.

Serial No.: 09/899,410

24. (Currently Amended) A method for communicating optical signals from a data service provider to at least one subscriber comprising the steps of:

propagating downstream optical signals at a single wavelength from the data service provider;

receiving the single wavelength downstream optical signals in a laser transceiver node from the data service provider;

dividing the downstream signals between preassigned multiplexers in the laser transceiver node with an optical tap routing device;

apportioning bandwidth between subscribers in the laser transceiver node;

multiplexing the downstream signals at the preassigned multiplexers; [and]

combining downstream RF modulated optical signals received from the data service hub with the downstream optical signals in an optical diplexer connected to an optical transmitter;  
and

propagating respective combined downstream optical signals at a single wavelength with an optical transmitter to at least one subscriber via at least one optical tap along at least one optical waveguide.

25. (Original) The method of claim 24, further comprising the step of assigning subscribers to respective individual multiplexers.

27. (Original) The method of claim 24, wherein the step of receiving downstream optical signals further comprises the substep of receiving at least one gigabit or faster Ethernet optical signals from the data service provider.

Serial No.: 09/899,410

28. (Original) The method of claim 24, further comprising the step of operating the laser transceiver node between -40 degrees Celsius and 60 degrees Celsius with passive temperature cooling devices.

29. (Original) The method of claim 24, further comprising the step of mounting the laser transceiver node to a strand in an overhead plant environment.

30. (Original) The method of claim 24, further comprising the step of housing the laser transceiver node within a pedestal in an underground plant environment.

31. (Original) The method of claim 24, further comprising the step of providing one of video, telephone, and internet services via the optical signals.

32. (Original) The method of claim 24, further comprising the steps of:  
splitting combined downstream optical signals with at least one optical tap; and  
propagating the split downstream optical signals to at least one subscriber along at least one optical waveguide.

33. (Original) The method of claim 24, further comprising the step of connecting between one and sixteen subscribers to a respective optical tap.

Serial No.: 09/899,410

34. (Original) The method of claim 24, further comprising the step of feeding one optical tap with optical signals from another optical tap.

35. (Original) The method of claim 24, further comprising the step of servicing between one and sixteen subscribers with the at least one optical waveguide.

36. (Previously Amended) The method of claim 24, further comprising a step of converting downstream signals by modulating at least one of Fabry-Perot lasers, distributed feedback lasers, and vertical cavity surface emitting lasers (VCSELs) to generate downstream optical signals.

37. (Original) The method of claim 24, wherein the step of apportioning bandwidth further comprises the step of allocating additional or reduced optical bandwidth for at least one particular subscriber optical interface relative to other subscriber optical interfaces in the optical network system.

38. (Previously Amended) The method of claim 24, wherein the step of dividing the downstream signals further comprises the substep of using a time division multiplex protocol to divide the downstream signals between preassigned multiplexers.

39. (Original) The method of claim 24, further comprising the step of maintaining substantially symmetrical data bit rates between the upstream optical signals and the downstream optical signals.

Serial No.: 09/899,410

40. (Original) The method of claim 22, further comprising the step of propagating the optical signals at data rates of at least 450 Mb/s.

Serial No.: 09/899,410

~~41. (Currently Amended) A method for communicating optical signals [from at least one]~~

~~between a subscriber [to] and a data service provider comprising the steps of:~~

~~propagating upstream optical signals originating from at least one subscriber to at least one optical tap;~~

~~receiving upstream optical signals at a laser transceiver node from the at least one optical tap;~~

~~converting the upstream optical signals to electrical signals at the laser transceiver node with an optical receiver;~~

~~demultiplexing upstream electrical signals with a demultiplexer;~~

~~combining upstream electrical signals in the laser transceiver node with an optical tap routing device;~~

~~apportioning bandwidth for at least one subscriber in the laser transceiver node with an optical tap routing device;~~

~~converting the combined upstream electrical signals into optical signals with a first optical transmitter; [and]~~

~~propagating the combined upstream optical signals to the data service provider along at least one optical waveguide; and~~

~~supporting downstream RF modulated optical signals with an optical diplexer coupled to a second optical transmitter.~~

42. (Original) The method of claim 41, further comprising the step of operating the laser transceiver node between -40 degrees Celsius and 60 degrees Celsius with passive temperature cooling devices.

Serial No.: 09/899,410

~~43. (Original) The method of claim 41, further comprising the step of mounting the laser transceiver node to a strand in an overhead plant environment.~~

44. (Original) The method of claim 41, further comprising the step of housing the laser transceiver node within a pedestal in an underground plant environment.

45. (Original) The method of claim 41, further comprising the step of providing one of video, telephone, and internet services via the optical signals.

46. (Original) The method of claim 41, further comprising the step of combining respective upstream optical signals originating from a plurality of subscribers with at least one optical tap.

47. (Original) The method of claim 41, further comprising the step of connecting between one and sixteen subscribers to a respective optical tap.

48. (Original) The method of claim 41, further comprising the step of positioning the laser transceiver node closer to the optical taps relative to the data service provider.

49. (Original) The method of claim 41, further comprising the step of feeding one optical tap with optical signals from another optical tap.

Serial No.: 09/899,410

50. (Original) The method of claim 41, further comprising the step of servicing between one and sixteen subscribers with single optical waveguides connected to respective individual multiplexers.

51. (Original) The method of claim 41, further comprising the step of maintaining substantially symmetrical data bit rates between the downstream optical signals and the upstream optical signals.

52. (Original) The method of claim 41, further comprising the step of propagating the optical signals at data rates of at least 450 Mb/s.
